

1 Foundations & Orientation

- **Overview** — models, what Copilot Studio is, where it fits
- **Instructions & Suggested Prompts** — a brief primer on how each shapes agent behavior

2 Knowledge Sources

Start simple — get the agent answering from documents and learn how to route the right question to the right source.

- **Hands-on:** wire up MS Learn, a single file, and a SharePoint document (note: *SharePoint* vs. *SharePoint*)
- **Routing with Topics** — teach the agent to pick the right source
 - Introduce the `Activity.Text` variable in context
- **Worked example:** using a knowledge source to perform a policy check

The 3 variables you should know — introduced here in context, then referenced throughout the day.

`Activity.Text`

`User.DisplayName`

`System.Conversation.Id`

3 MCP Tools with Business Central

The newest path — fast to set up, broad coverage, but with real trade-offs you'll feel quickly.

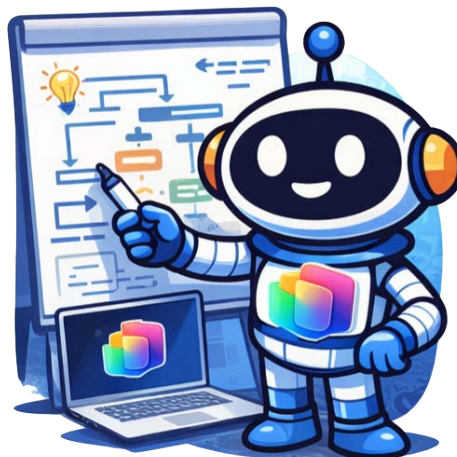

Setup & Exercises

- A touchpoint on **API pages**
- Configure MCP in BC
- Quick exercises in Copilot Studio:
 - Pull data
 - Write data
 - Slightly advanced — query across multiple tables
 - Quick wins with financial APIs (Aged AR, Income Statement, etc.)

When MCP Isn't the Right Fit

- Tool discovery can take a minute
- Doesn't expose every tool (e.g. `GetURL`)
- Limited parameter flexibility:
 - No "Top 20", no OData filters, no Table Filters, Dynamic vs. Custom fill

Along the way: we'll touch **WorkIQ connectors** for simple Copilot queries (good example: link to email) and the **M365 Outlook MCP** alongside its traditional connector counterpart.

4 The Traditional Power Platform BC Connector

Where the real flexibility lives — finer control, formatting, and orchestration.

- **Find Records** — vs. Find One Record vs. Get Record
 - Organizing results: table format, sorting/filtering in prompt vs. instruction, numeric formats
 - Send-as-email: HTML formatting and signature
 - Enhanced instructions
- **Create Record** — simple create (possibly with dynamic table); without and with Adaptive Card
 - Side exercise in M365 Copilot: generating the JSON payload
- **Update Record** — the systemId principle and how to retrieve it first
- **Deep links to BC records** via GetURL
- All of the above lead into **process-based instructions**
- **Autonomy with Triggers** · brief touchpoint on **Evals**
- **Publishing:** Teams, M365 Copilot — quick showcase of SharePoint & Web
- **Deploy into BC** — **today vs. tomorrow:** Page Part vs. the future state announced at Directions

5 Prompt Builder & Agent Flow

Prompt Builder

- Table Filter example
- Vendor query split example

Agent Flow

- Write a row to Excel — Excel connector + Flow

6 Bonus Topics & Resources

- Licensing & credit usage — a few notes worth knowing
- **Copilot Studio Kit** — namedrop & why it matters
- A short scenario with **Code Interpreter**
- Using **Suggested Prompts** — and a workaround for some deployments

WHAT YOU'LL LEAVE WITH

- A working mental model of MCP vs. traditional connector trade-offs
- Patterns for knowledge routing, data writes, and deep links into BC
- Reusable instruction techniques for formatting, filtering, and email output
- A clear path from prototype agent → published & deployable

NOT COVERED TODAY

- Custom REST API Connector
- Component Collections
- Multi-Agents / Connected Agents / Child Agents
- Export / Import Solutions · Pipelines
- Computer Using Agents (CUA) · Chit-Chat assistant
- SharePoint Lists · Knowledge Source variable
- Analytics · Enhanced RAG with Azure AI Search
